A series of 4*H*-imidazole 3-oxides have been prepared *via* condensation of α -hydroxyamino ketones with aldehydes and ammonia and subsequent oxidation. A convenient method of nitrosation of the 5-methyl-4*H*-imidazole 3-oxides has been developed. The resulting 4*H*-imidazole-5-carbaldehyde oxime 3-oxides were converted to nitriles. The later were shown to react with various nucleophiles via cyano group substitution.
